To name a particular grammatical sub-category (e.g., comitative case), use the appropriate root/stem above in conjunction with one of the following rules:

- To name a noun case or verbal format, use the stem -- above in conjunction with the specialized C_S-root (see Sec. 4.2 of the Design Document) of the Type-2 case-accessor affix for the case in question. For example, the COMITATIVE case would be named *warmpa ëizyi've* ‘grammatical case/format associated with that which accompanies’.

2.1 TOOL USE

NOTE: Previous versions of this document indicated that the naming of most tools would be accomplished using various affixes attached to verbal stems indicating the desired action or result. 3.2 MOTION AND SPATIAL POSITION

English can create succinct “moving images” of complex trajectories, paths, treks, and in-situ movements by simple juxtaposition of locative/directional particles (i.e., prepositions acting mostly as adverbial particles). For example , imagine the manager of a basement nightclub talking to a friend on the sidewalk outside his club. He invites the friend to the small patio outside the back of the club, which one finds by descending into the club, going past the dance floor, up a flight of stairs, and down a long hallway to the back door. He does so by saying, *‘Come on down inside up along through out back to the patio.’*

New Ithkuill allows one to create similar succinct “moving images”. Each motion root (whether referring to in-situ or translative motion) has a corresponding -VxC_S affix of the same form (e.g., the root -KR-for ‘OBLIQUE LINEAR MOTION’ has a corresponding suffix -kr.) Each of these suffixes has the following nine degrees:

1	Interior perlicative motion/movement in a manner described by the suffix's corresponding root among/within an external/surrounding/underlying (quasi-)static medium. For translative motion suffixes, implies motion along a course described by the suffix's corresponding root where the course is set, determined, or prescribed by an externally surrounding/underlying medium/channel, etc.
2	Interior motion/movement: static or translative movement/motion in a manner described by the suffix's corresponding root while inside another object/entity (where, unlike the perlicative degree, the exterior object/entity does not define/prescribe/determine the course of the moving object/entity)
3	Implies entry from an exterior space/medium/context into an interior space/medium/context
4	Implies continued/continuous movement in a manner described by the suffix's corresponding root; for translative motion suffixes, implies continued/continuous motion along a course/direction described by the suffix's corresponding root
5	Implies a single motion in a manner described by the suffix's corresponding root across from one point/side of the contextual space to another; for translative motion suffixes, implies a single motion along a course/direction described by the suffix's corresponding root across a gap/gulf/space from one place to another
6	For translative motion affixes, signifies motivational “on” as in “come on”, “go on”, “move on” - implies/reinforces need/impetus to begin/keep moving in the manner or direction described by the suffix's corresponding root without stopping. For static positional affixes, operates merely as a locative to specify an entity's X/Y/Z position.
7	Implies exit from an interior space/medium/context out to an exterior space/medium/context
8	exterior motion/movement: static or translative movement/motion in a manner described by the suffix's corresponding root while outside another object/entity (where, unlike the perlicative degree, the other object/entity does not define/prescribe/determine the course of the moving object/entity)
9	exterior perlicative motion/movement outside of, over, next to, alongside, “above”/“under” an adjacent (quasi-)static surface/medium; for translative motion suffixes, implies motion on a course described by the suffix's corresponding root along, over, parallel to, around, “above”/“under”, or tracking/following an adjacent (quasi-)static surface/medium

For Degree 6, the various Modulative suffixes as well as Phase can be used to describe repeated, ongoing movement/motion, e.g., back-and-forth, to-and-fro, side-to-side, up-and-down, in-and-out, out-and-back, etc.

Besides movement/motion roots, roots denoting any spatial referent/area would also have corresponding affix-forms utilizing this pattern (e.g., front side, rear area, top area/space, area below/underneath, etc.).

3.5 POSITIONALLY-DEFINED COMPONENTIAL PARTS OF A WHOLE

As seen above, Stem Zero of -T- type spatial position roots convey the meaning of “the area/vicinity around X”, so that Stem Zero of the root -K- above would mean “the area behind or in back (of)”. Nevertheless, as in Ithkuil, separate roots exist to describe positionally-defined componential parts of an entity, to distinguish “the area behind or in back of” from “the rear/back part/side of” where the latter refers to a part of the entity itself. This allows one to distinguish phrases such as “behind the box” from “the back/rear side of the box.”

-SP- ‘COLOR’		Associated affix: VSR
BSC	STEM 1: (to be) something having a (particular) color / something colored	STEM 2: Same as Stem 1 but a hue 15 degrees counter-clockwise on a 8-basic-valued 360-degree color-wheel (i.e., one-third of the way to the next basic color value, or half-way to Stem 3 of the next basic color value).

CSV	(to be/manifest) the (reflected) light of (a certain wavelength) that is perceived by an observer as being a particular color	STEM 3: Same as Stem 1 but a hue 15 degrees clockwise on a 8-basic-valued 360-degree color-wheel (i.e., one-third of the way to the next basic color value, or half-way to Stem 2 of the next basic color value).
OBJ	(to be) an entity having a particular color (e.g., “the red one”)	

Primary Color Roots/Stems. There are eight roots for basic colors, shown below as A through H. The prototype color is Stem 1 (labeled as a numeral 1 following the letter); Stem 2 is the color one-third of the way to the next basic color to the left (labeled as a numeral 2 following the letter); Stem 3 is the color one-third of the way to the next basic color to the right (labeled as a numeral 3 following the letter). Thus, 24 basic color terms exist in the language.

	-GY- ‘RED’	-NR- ‘ORANGE’	-ML- ‘YELLOW’	-ČW- ‘GREEN’	-DR- ‘CYAN’	-LW- ‘BLUE’	-ŽL- ‘VIOLET’	-VM- ‘MAGENTA’
Stem 1	red	orange	yellow	green	cyan	blue	violet, purple	magenta
Stem 2	pinkish-red, rose	reddish orange	orangy-yellow, gold(en yellow)	yellowish-green, chartreuse	greenish blue, teal blue	lighter blue, royal blue	blue-violet	violet-magenta, purple-magenta
Stem 3	orangy-red	yellowish orange, ochre	greenish-yellow	light-bluish green, teal green	azure blue	violet-blue	magenta-violet, magenta-purple	dark rose, rose-magenta

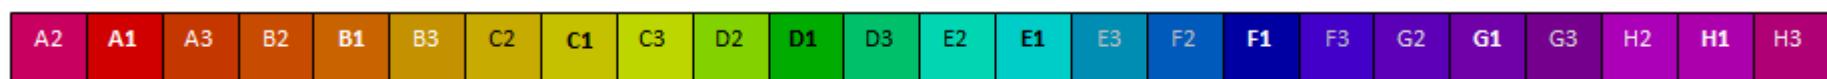

The CLD and COL affixes may be utilized with all color stems (as well as non-color stems where semantically productive). For dichromatic (2-colored) descriptions, concatenate one color stem into another using COMITATIVE format.

As can be seen from the two strips below, the eight basic color roots with their three stems, in conjunction with the CLD affix, are sufficient to provide equivalents to standard Western color terms. Note that the Western basic color terms ‘pink’ and ‘brown’ do not have roots. The various shades covered by those two color terms are expressed as derivatives of red or magenta, and orange respectively. Use of the CLD affix also provides terms for more obscure shades such as “peach”, “mauve”, “turquoise”, “indigo”, “olive”, “rust”, “burnt sienna”, “cobalt blue”, “forest green”, “beige”, “burgundy”, etc.

Light/pale colors: below is the same color strip of the basic color roots/stems plus the CLD/2 affix:

Dark/deep colors: Here is the color strip of the basic color roots/stems plus the CLD/8 affix:

Using the COL affix, in conjunction with Phase and the Modulative affixes, one can add qualities such as “gleaming,” “twinkling”, “opalescent”, “glittering”, etc. In addition to the above scheme, the COL/7 affix provides for terms based on the color of a tangible object.

Three Additional Basic Color Roots: The following three roots do not follow the same template as the eight roots above (as they do not have hue variation):

-BV- ‘WHITE’: Stem 1) something white; 2) something light-colored or pale-tinted; 3) something whose color/visibility is washed out by bright light/glare

-XM- ‘BLACK’ Stem 1) something black; 2) something of a dark shade; 3) something obscured by low light or poor viewing conditions

-VR-	-LL-	-KS-	-Z-	-PŠ-	-ST-	-CP-	-NS-	-ČK-	-LZ-	-J-	-GZ-	-PC-	-KZ-	-ČG-

The following six number roots are used when needed to designate numbers beyond ten when needed for counting and mathematical operations involving non-decimal number bases up to base-16. They may also be used as “short-cut” substitutes for the standard decimal/centesimal forms using the TNX affix.

11	12	13	14	15
-CG-	-JD-	-LJ-	-BC-	-TZ-

Whole numbers are full formatives signifying a set containing the particular number of members. The “simple” everyday counting system is base-100 (the mathematical sub-language will utilize base-12). Beginning with ‘two’, the Stem & Specification pattern is illustrated by the root -Z- ‘three’ below:

OBJ	(be) an object/entity which manifests the particular closed (quasi-)linear outline shape

The following roots all have a Stem & Specification pattern based on the above root.

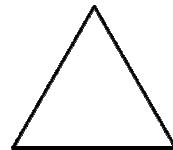

In general, the pattern of roots for planar and three-dimensional shapes is as follows: The basic closed planar shape (e.g., a circle, a square, an equilateral triangle, etc.) has a tri-consonantal root ending in **-L**. The three-dimensional extension of such a root with a rectilinear base changes this **-L** to **-R**. The three-dimensional extension of such a root with a radial or circular base changes it to **-W**. If the shape has an associated open-ended linear outline form, this is expressed by changing the last consonant of the root to **-R** or **-Y**.

Muscles, Ligaments and Other Tissues/Structures

The following roots/stems name the various muscles and ligaments of the human and/or mammalian body. In a few instances, important tissues other than muscles and ligaments (e.g., fascia, retinacula, membranes, and tendons) have been assigned stems as well. For those non-bone or non-muscle tissues not assigned a stem, concatenate the stem for the particular tissue-type (e.g., tendon, fascia/membrane, retinaculum, enthesis) with the stem for the bone, muscle, or organ to which the tissue is connected or associated. DYN Function refers to muscle contraction or ligament tension/pulling.

7.2.2 Bodily Fluids, Secretions, Excretia

While many bodily fluids/secretions/excretia can be named by either utilizing the **ROC/8** affix with an existing stem naming a bodily process (e.g., urination, ejaculation, etc.) or by concatenating **-TKL-** Stem 2 or **-RTKL-** Stem 1 into a stem naming a body part, it is nevertheless convenient to have lexical stems for the most common of such fluids/secretions/excretia.

Keep in mind that, while the English translations of the following stems are almost all non-count/mass nouns, the Ithkuil stems are countable, each meaning “(to be) an amount of” the particular substance/fluid in question. The stems below have the following Specification pattern.

BSC	Stem 1: (to be) a state/act/process of (the body) producing/having (a volume/amount of) the particular bodily fluid/secretion/excretia
CTE	(to be) an amount of the particular bodily fluid/secretion/excretia
CSV	(to be) a state/act/process of secreting/excreting an amount of the particular bodily fluid; to secrete/excrete an amount of the particular bodily fluid/secretion/excretia
OBJ	(to be) the organ or gland which secretes the particular bodily fluid/secretion/excretia

7.2.4 Parasitic/Microbial Diseases

The following are lists of diseases along with the stems indicating their parasitic or microbial pathogens. These parasitic/microbial stems are excerpted from the taxonomic lists in Sections 7.3.1, 7.3.3, 7.3.4, 7.3.5, and 7.3.6 of this document. To name a particular pathogenic disease, either concatenate a pathogen stem below with an appropriate stem from one of the various applicable roots shown above, or add the new **ADI** affix below to the stem.

7.3 BIOLOGICAL LIFE-FORMS

In addition to roots and stems associated with formalized, hierarchically arranged biological taxonomies (which are beginning in Sec. 7.3.1-+), the following roots and stems are available for informal use when talking about biological life-forms in general:

-SW- ‘LIFE-FORM, LIVING THING’			
BSC	STEM 1: (to be) a living being; a life-form; a form of life; to be something that is alive		
CTE	(to be) the individual essence/soul, set of instincts, or mind of a life-form (that distinguishes it from other individuals)		STEM2: (to be) something vital; manifest vitality; activity consistent with being alive
CSV	(to be) the physical body or corporeal aspect of a living thing		STEM 3: (to be) something reproduced or brought to life; to reproduce [biologically], bring to life
OBJ	(to be) an entity/party impacted/affected by the presence of, or interaction with a living being		

As will be seen beginning in Sec. 7.3.1 in the quasi-taxonomic listings of animals, numerous animal classes are divided up into several roots due to the diversity of similar taxonomic/phylogenetic orders, sub-orders, infra-orders, families, super-families, etc. An example of this is the myriad number of moth types. However, it becomes necessary for laypersons to have a simple generic term for ‘moth’ irrespective of the particular type of moth. While the **RES**, **TXN**, and **HSR** affixes listed later below are available to form generic terms, these generic notions of animal types are semantically salient enough to warrant their own “shortcut” roots/stems for non-scientific, non-taxonomic lexical categorization. Such roots/stems are provided here; they follow the same Specification pattern as the root **-SW-** above:

7.3.0.1 Preliminary Note on Quasi-Taxonomic Roots/Stems Denoting Biological Life-forms

Beginning in Section 7.3.1 below, the roots and stems or specific life-forms are presented. The general rule regarding roots associated with biological life-forms is the use of a simple two- or three- (sometimes four-) consonant root to designate the “base level” (i.e., most common or most representative) genus and/or species of a particular class/family/order/sub-order of animals, e.g., common domesticated animals, common insects, common birds, common reptiles, etc. Each of these roots then serves as the basis for expansion of the root by a single consonant (e.g., the adding of -y, -w, -l, -r, -ř, -m, -n, -f, -t, -v, etc. and/or the prefixing of l-, r- or ř-) to designate less common genera in the same class/family/order/sub-order or to designate corollary or associated roots.

When the distinction between similar life-forms is a common one, stems are assigned to individual species within a genus. Otherwise, the designation of species and sub-species is to be accomplished via use of a Type-2 V_XC_S affix or via Type-2 stem concatenation, the specific affixes and concatenated roots as-yet-to-be-determined. As an example, Stem No. 3 of the root -RRN- ‘OCELOT-LIKE FELINES’ designates any less common species of the genus *Leopardus* other than the ocelot itself (*L. pardalis*) (designated by Stem No. 1) or the margay (*L. wiedii*) (designated by Stem No. 2). Therefore, Stem No. 3 refers to an animal that could be either an oncilla (*L. tigrina*), an Andean mountain cat (*L. jacobita*), a Pampas cat (*L. colocola*), a kodkod (*L. guigna*), a southern tigrina (*L. guttula*), or Geoffroy’s cat (*L. geoffroyi*). To distinguish these individual six species, either an appropriate Type-2 V_XC_S affix would be used or a Type- 2 concatenated stem. At this time the author has not yet assigned the specific affixes or stems to be used due to time constraints.

NOTE: The three stems of many of these roots are structured to reflect quasi-trinary divisions within the scientific taxonomies of each animal-type. Often, these quasi-trinary distinctions are of little practical importance to laypersons, in which case the use of Stem “Zero” may be of the most practical value when referring to the particular animal. As an example, the three stems of the root -MVY- refer to the three species (or sub-species) of bison; however, most speakers will likely be uninterested in (or ignorant about) distinguishing between a plains bison versus a wood bison versus a wisent; thus, use of Stem “Zero” to refer simply to a bison is convenient. (Alternately, use of Stem 1 with additional morphology such as a “fuzzy” configuration, or RPV Essence, or the REA/7 affix may be used.)

7.3.0.2 Affixes Used with Taxonomic Stems for Genus or Species or Sub-Species Identification

In addition to Type-2 stem-concatenation, the following affixes are available to use with biological life-form stems to help differentiate (or, if used as a Type-2 affix, to formally name) the species or sub-species of a particular genus, or in cases where a stem refers to an entire family or class of life-forms (as is the case for less familiar or less differentiated life-forms such as annelid worms), to identify or name a particular genus. (Note that the use of affixes to identify species of a genus are certainly not limited to the following affixes; these affixes are presented here only because they have been specifically designed for use with such stems. Conversely, these affixes may also be used with any relevant/applicable stem, and are not reserved solely for use with stems denoting biological/taxonomic life-forms.)

7.3.1 Animals

All of the following stems referring to living animals have the following Specification structure:

BSC	(to be) an animal as a holistic entity, including its physical/corporeal body and its and mental identity and living essence; to live/be alive
CTE	(to be) that which gives a particular animal its individual identity; the living essence or mental identity of an animal
CSV	(to be) the physical body of an animal; the corporeal aspect of an animal
OBJ	(to be) an activity engaged in by an animal; what an animal is doing; to act (as a particular animal species does)

The listing of roots and stems below are grouped by more or less familiar taxonomic classification schemes, with pragmatic factors such as degree of familiarity/utility among laypersons taken into account. For example, animal orders/classes familiar to laypersons such as mammals have many stems at the species level, while unfamiliar orders/classes such as Annelids forego taxonomic lexicalization entirely and instead lexicalize common-sense, superficial morphological distinctions, i.e., ‘earthworm’ vs. ‘leech’, vs. ‘other ringed/segmented worm’.
